

OO software engineering has been a well-known software engineering methodology for years; however, there are still some issues remaining unsolved: the engineers using imperative software engineering have a large gap to stride across when adopting OO software engineering; the software may have some problems resulting from process issue; and a generic mechanism for checking consistency of designs is still lacking. A new methodology is represented to provide a complete global view of OO software system, which solves issues that are identified. It uses requirements document and some analysis documents as foundation because these three issues intersect in the early analysis phase. Three case studies are also represented to exemplify the results of applying the proposed methodology on both OO software engineering and imperative software engineering.
